

Reconciliation Bridge

Step	Description	Result	Reason
0	Initial communication-log count	30	We began by counting all communication records associated with Merchant 501 during October 2026. This produced an initial count of 30 records.
1	Exclude non-finalized campaign 9004	26	Campaign 9004 was still pending approval and therefore was not considered finalized. Its 4 associated records were excluded, reducing the count from 30 to 26.
2	Deduplicate retry campaign chains	22	Several customers appeared multiple times due to retry attempts. Within each retry campaign family, repeated entries for the same customer were counted only once. This reduced the total from 26 to 22.
3	Final target base	22	After excluding the non-finalized campaign and removing duplicate retry entries, the final reconciled count is 22 , which matches Finance's expected value.

Detailed Breakdown

- 1. Retry Campaigns:** There were **19 send attempts** in total. Some were repeated for the **same customer within the same campaign family**. After **removing these duplicates**, **15 unique** combinations remained. Therefore, the retry campaigns account for 15 sends.
- 2. Standalone Campaign:** The **standalone campaign contains 7 sends**. Each send is counted separately, even when the same customer appears more than once.
- 3. Final Count:** **15(Retry Campaigns) + 7(Standalone Campaigns) = 22**
- 4. An interesting thing that surprised me in the data** was that the retry campaigns had 19 send attempts, but after removing repeated entries for the same customer within a campaign family, only 15 unique combinations remained. The difference between the total send attempts and the final counted entries was noticeable. However, it did not affect the final count because the repeated entries were removed during the reconciliation.
